

# Docsis 3.1 DATA-TV filter with diplexer

With the introduction of Docsis 3.1, most in-home networks are not suitable for the enhanced frequency ranges; both forward (258-1218MHz) and return (5-204). E.g. most in-home outlets have an FM-port, making the FM unusable for Docsis 3.1 return path data.

The Docsis 3.1 DATA-TV filter offers the possibility to separate the Docsis 3.1 signals at the Home Network Interface, i.e. at the interface between the distribution network and the in-home network. In that way, what happens in the in-home network is not influenced by the new frequency bands, and the need to update is reduced. Also, the distribution network is shielded against any disturbance picked-up in the in-home network in the return path band. The Docsis 3.1 DATA-TV filter contains a diplexer, which reduces the insertion loss in the return path band.
